Samwoh Eco-Green Building is the first building in this region to be constructed using up to 100% recycled concrete aggregate (RCA) after extensive research and development works. This masterpiece of structural building showcases a revolutionary way of using RCA and other green features. Fiber optic sensors have been installed in the building to monitor the behavior of the structures under actual loading condition.

This landmark building has attained the highest level in the BCA Green Mark certification - the Platinum Award. It has brought the green construction technology to another new height and opened up a new chapter in Singapore's sustainable development.

The successful completion of the Eco-Green Building provides the viability of using RCA for structural works. It is a technological breakthrough for the industry and will reduce the dependence on natural aggregate and thereby, contribute towards our nation's goal to achieve sustainability.

We have setup an exhibition gallery in the building and it is opened to the public for educational purposes. Interested parties please contact us at info@samwoh.com.sg for appointment.
